

ques. i/p from user & check if it is even +ve even -ve  
odd +ve or odd -ve (using nested-if)

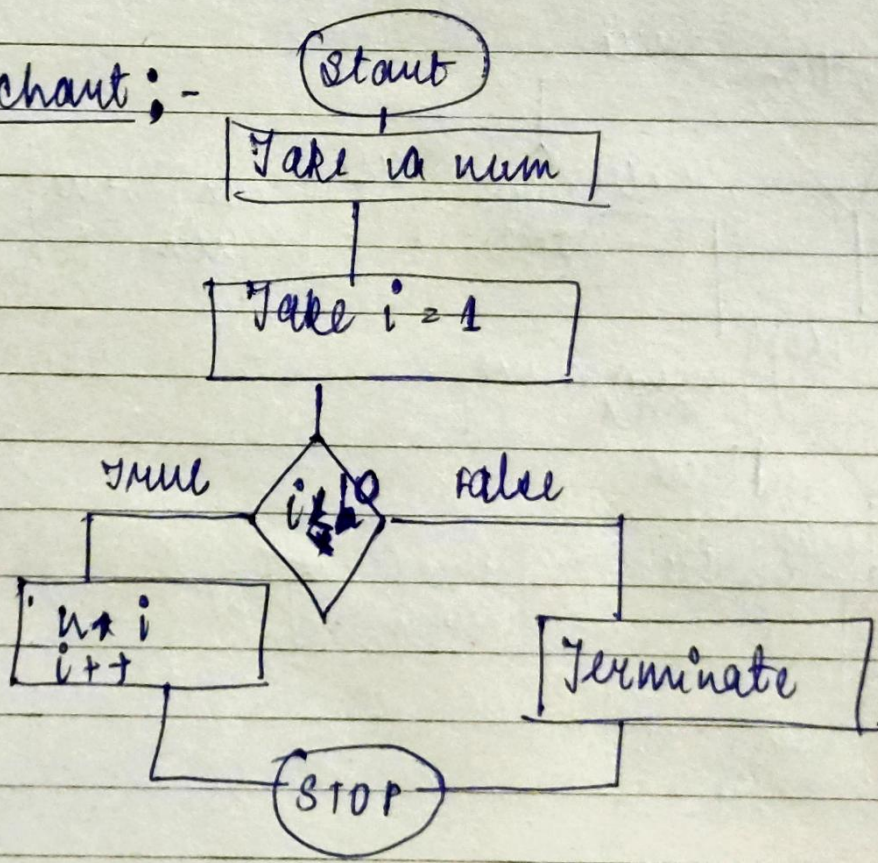

Ques. 5) Write the steps, flowchart and pseudo code:-  
Print the table of any number (using for loop)  
Algorithm:-

- ① Take input =  $n$  (any number from user)
- ② Use loop as we want to print the table of any number. A line of code is executed again & again. So we have to use loop for that.
- ③ Logic is loop start from 1 to  $n$  and value of  $i$  gets update
- ④ Logic - ~~len~~  $n * i$ ;
- ⑤ Print ( $n * i$ );

Flow chart:-

Pseudo code :-

isb (1) i/p = number 10

(2) for (i = 0; i <= ~~number~~ <sub>10</sub>; i++)

Print (n \* i);

}
